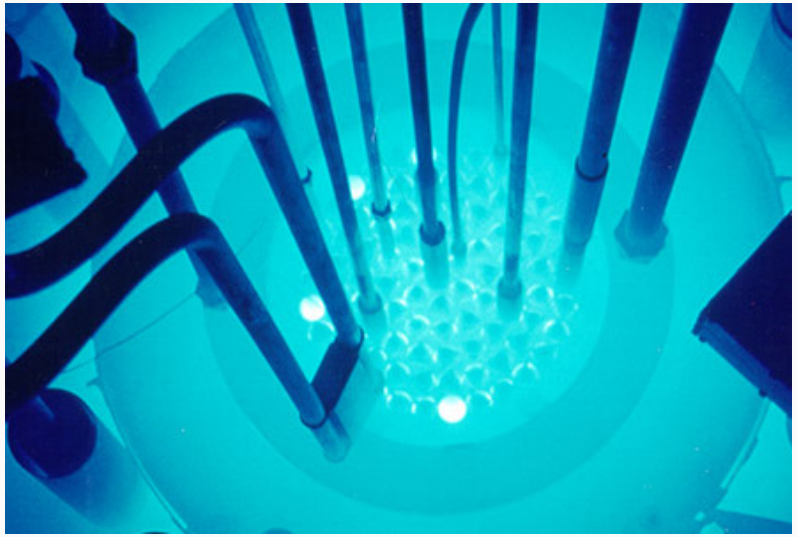
Table of Contents

Cyber-Physical Systems

Digital devices that interact with their physical environment



Another example of a cyber-physical system

. . . and yet some other cases

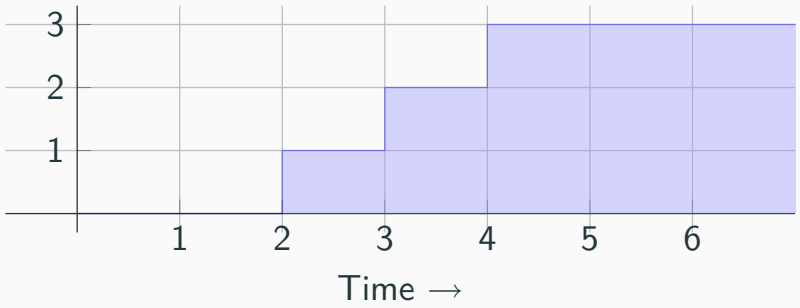
- Semi-autonomous self-driving systems
- (Crewed) spacecrafts

The three ingredients of cyber-physical systems

- Concurrency
- Communication
- Hybrid interaction

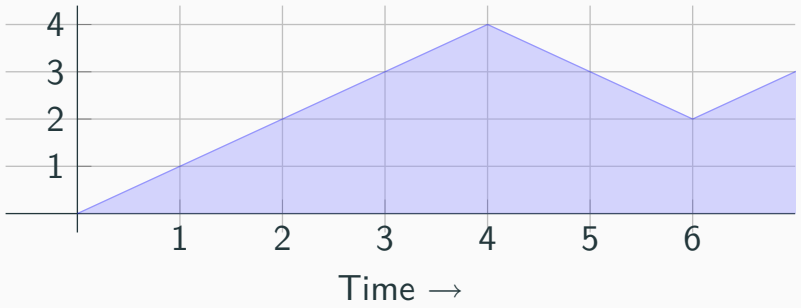
Computer Science meets Analysis

Wait Calls



$(\texttt{wait}\ 2)\ ;\ \texttt{x} := \texttt{x} + 1\ ;\ (\texttt{wait}\ 1)\ \ldots$

Differential Statements

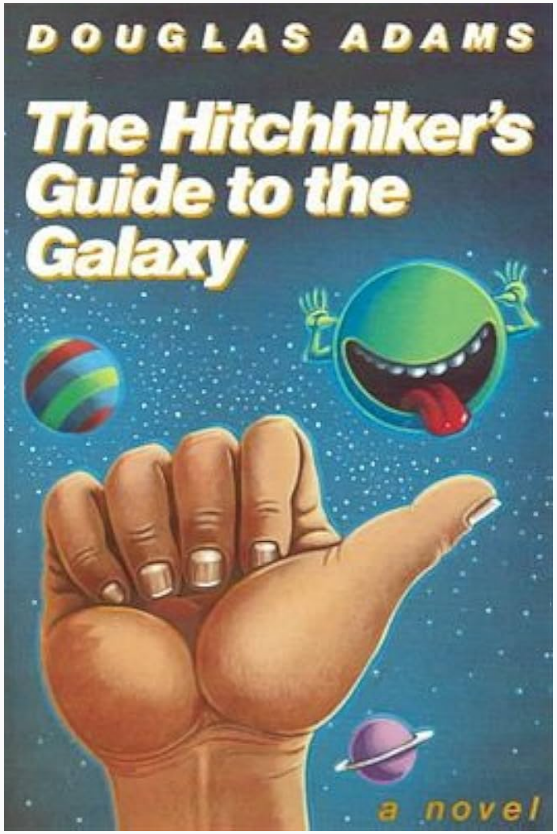


$$\begin{aligned}&\texttt{while}\,(\texttt{true})\,\{\\&\texttt{if}\ \texttt{v} \leq 2\\&\qquad\texttt{then}\ (\dot{\texttt{v}} = 1\ \texttt{for}\ 2)\\&\qquad\texttt{else}\ (\dot{\texttt{v}} = -1\ \texttt{for}\ 2)\ \}\end{aligned}$$

A particle and its orbital trajectory – what can go wrong?

```
x := -1; v := 0; a := 1;
while true do {
      if x <= 0 then a := 1; else a :=-1;
      x' = v, v' = a  for 0.5;
}
```

Cyber-Physical Computation



What is actually computable ?

Cyber-Physical Computation

Genesis: David Hilbert and its
Entscheidungsproblem (circa 1928)

Fuelled the appearance of first models of computation (*circa* 1936)

- Turing machines: state-based, part of automata theory
- λ-calculus: function-based, prototypical programming lang

Church-Turing Thesis

Computable if encodable as a Turing machine or (equivalently) as a λ-term

Table of Contents

Contents of the course pt. I

We will study diverse models of cyber-physical computation

- (timed) automata,
- a hybrid while-language,
- λ-calculus extended with computational effects (monads!)

Contents of the course pt. I

We will study diverse models of cyber-physical computation

- (timed) automata,
- a hybrid while-language,
- λ-calculus extended with computational effects (monads!)

and often make detours through the mathematical foundations of automata and programming language theory ...

Contents of the module pt. II

We will get accquainted with diverse tools

- **Uppaal** verification of real-timed systems modelled by (networks of) timed automata
- **Lince** agile analysis of cyber-physical systems modelled by a hybrid while-language
- **Haskell** a platform to study λ-calculus with effects

How deep will we go into the rabbit hole?

Our learning path will intersect theory and practice, from the very basics to the state-of-the-art — we will face current limitations and see what challenges lie ahead

Table of Contents

Assessment

Two individual assignments (about the modelling and analysis of cyber-physical systems)

Materials and Contacts

Relevant class material and announcements posted on the website
